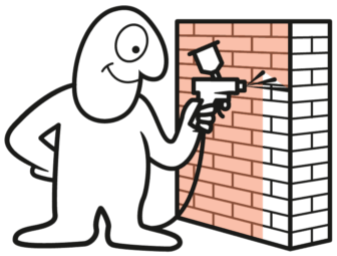
DUSTCONTROL 984

Soil and sand stabilisation



Stabilisation of sandy or dusty surfaces is not just a matter of pollution it is as well a matter of reduced effectivity of photovoltaic facilities and erosion of natural landscapes. Airborne dust is often more than an annoyance, once the dust settles the fine layer covers effectively photovoltaic facilities. This is especially a problem in large facilities with hundreds or thousands of elements. Erosion through wind or storm destroys dune landscapes and wind freight transporting particles from landfills (especially soil heaps from coal power plants) pollute the surrounding area.
