CEMBOND 967 RESTORATION PLASTER

past-treatment after horizontal barrier,
dehumidifies and desalinates wet walls

Cembond 967 restoration plaster dehumidifies and desalinates wet walls, which come along with high salinity. Restoration plaster is always second step after initial waterproofing. The high pore volume of 967 collects the salts, which will crystallize while drying and prevent the wall from damages through salt efflorescence. The plaster is highly permeable to carry out the drying of the wall.
