HYDROBLOC EP CURING 904

epoxy curing prevents the concrete from drying out too quickly

HydroBloc EP Curing 904 is an evaporation protection for fresh concrete and screed. The after treatment agent is a vapour barrier and protect against fast drying out which causes cracks and other damages. Applied directly after mechanical smoothing or removing of the formwork, HydroBloc EP Curing 904 seals the surface and reduces water loss due to evaporation. The water based epoxy resin has an additional advantage. The impregnation is at the same time a wonderful primer and bonding bridge for following coatings. It doesn't hinder following paints, coatings or bonded coverings.
