TRÖPPEL CONTAINER 019

storage container for pressure less injection

Tröppel container is an accessory for horizontal barriers against raising damp. The application method depends on the water saturation level. Water saturated walls (> 50%) need pressure injection. Below 50% water saturation the pressureless injection uses the absorptivity of the wall. Horizontal barrier material will be sucked through a pipe into the wall where it spreads itself. In this situation the water is the carrier for the active substance.
